fiber optic diffuse reflection sensors with extremely small bending radius	12
accessories	13 - 15

through-beam sensor operating range up to 14m
 dif. reflection sensor sensing range up to 600mm

- ✓ small sensing heads with different lines of sight (axial, angular, flexible)
- ✓ trouble-free shortening of the plastic fiber optics
- ✓ small bending radius, low weight
- ✓ possible application in explosion-hazardous areas
- ✓ no interference by magnetic or high-frequency fields (welding plants, switchgear et al.)
- ✓ contactless detection, counting, controlling, positioning
- ✓ scanning of micro objects in processing stations, feed systems and automatic systems

**robust, flexible
vibration-proof**

description

The **ipf** plastic fiber optic systems consist of a flexible plastic fiber with a sensing head and an optoelectronic fiber optic amplifier.

The principle of operation is similar to a through-beam sensor or a diffuse reflection sensor. The optoelectronic fiber optic amplifier includes transmitter, receiver, evaluation electronics and amplifier. It uses e.g. visible red light (660nm), which is transmitted through the fiber by the principle of total internal reflection (see figure "reflection inside plastic fiber optics").

We offer a wide choice of sensing heads that can be adapted to suit varying field conditions, e.g. as a diffuse reflection sensor or as a through-beam sensor with axial or later-

al light exit or with a 90mm flexible stainless steel sleeve which is even capable of "looking" around corners, if needed.

The advantages of plastic fiber optics are the small bending radii. The fiber optics are bendable in any directions within the stated bending radii. It is also possible to cut the fibers in the field to any desired length using the fiber cutter **AL000007**.

application examples

- ▶ contactless detection, counting, controlling, positioning
- ▶ scanning of micro objects at processing stations, feed systems and automatic systems

reflection inside a plastic fiber

application

The excellent optical and mechanical characteristics of *ipf* plastic fiber optics mean they are particularly well-suited to the sensing of small objects in production and automated systems, especially where difficult environmental and installation conditions exist (e.g. in environments with high levels of vibration). As no electrical energy is transmitted over the fiber optics it is possible to use them in applications with high magnetic fields and with high levels of electrical noise or in radioactive environments as well as in explosion-hazardous areas. In these cases it is necessary to mount the amplifier away from the hazardous area.

through-beam sensor

diffuse reflection sensor

Plastic fiber optics can be found in a wide variety of industries including machine building, chemical, pharmaceutical, ceramics and plastics.

notes

If there is too much of a kink in the fiber optics, or if they get nicked by sharp objects, then this will cause a dimming of the light in the fiber optics. In case of high mechanical stress (e.g. bending or squeezing for many times) the plastic fiber optics can be damaged at the highly stressed points.

For the installation it must be considered that plastic fiber optics can only be used for applications within the temperature range -40 °C to +80 °C. For higher temperatures *ipf* uses glass fiber optics. Chemicals such as organic solvents or gasoline may damage plastic fiber optics.

Notes on the fiber optics beginning on page 7:

When using an OL10034x series amplifier, it is possible to set four different response speeds.

The light intensity of the transmitter LED changes with the response speeds. This in turn results in a change to the operating range.

The stated operating ranges correspond to those of the red light device OL100340 in the programmed mode "STD".

When using other amplifiers, it is possible that the achievable range (sensing range/operating range) may differ from the stated values!
